

EARLY PREDICTION FOR CHRONIC KIDNEY DISEASE DETECTION: A PROGRESSIVE APPROACH TO HEALTH MANAGEMENT

OVERVIEW:

Chronic Kidney Disease (CKD) is a major medical problem and can be cured if treated in the early stages. Usually, people are not aware that medical tests we take for different purposes could contain valuable information concerning kidney diseases. Consequently, attributes of various medical tests are investigated to distinguish which attributes may contain helpful information about the disease. The information says that it helps us to measure the severity of the problem, the predicted survival of the patient after the illness, the pattern of the disease and work for curing the disease.

In world as we know most of the people are facing so many disease and as this can be cured if we treat people in early stages this project can use a model to predict the Chronic Kidney Disease which can help in treatments of peoples who are suffer from this disease.

Technical Architecture:

Project Flow:

User interacts with the UI to enter the input.

Entered input is by the model which is integrated.

Once model analyses the input the prediction is showcased on the UI

To accomplish this, we have to complete all the activities listed below,

Define Problem / Problem Understanding Specify the business problem

- Business requirements
- Literature Survey
- Collect the dataset
- Data Preparation

Exploratory Data Analysis

Descriptive statistical

- Visual Analysis
- Training the model in multiple algorithms
- Testing the model

Performance Testing & Evaluate the results

Testing model with multiple evaluation metrics

- Evaluate the results

Model Deployment

Save the best model

- Integrate with Web Framework

Project Demonstration & Documentation

Record explanation Video for project end to end solution

- Project Documentation-Step by step project development procedure

Project Structure:

Create the Project folder which contains files as shown below

We are building a flask application which needs HTML pages stored in the templates folder and a python script app.py for scripting.

CKD.pkl is our saved model. Further we will use this model for flask integration.

Training folder contains a model training file.

Define Problem / Problem Understanding

Activity 1: Specify the business problem

Refer Project Description

Activity 2: Business requirements

The business requirements for a machine learning model to predict chronic kidney disease include the ability to accurately predict the based on given information, the number of false positives (predicting diseased) and false negatives (not diseased). Provide an explanation for the model's decision, to comply with regulations and improve transparency.

Activity 3: Literature Survey (Student Will Write)

Chronic kidney disease (CKD) is a significant public health issue, affecting an estimated 14% of the global population. The disease is characterized by a gradual loss of kidney function over time, leading to a range of serious health complications, including end-stage renal disease (ESRD) requiring dialysis or kidney transplant. Early detection and management of CKD is crucial to prevent progression to ESRD and improve patient outcomes.

There have been numerous studies in recent years aimed at developing accurate and efficient methods for predicting CKD progression. These studies have employed a variety of techniques, including machine learning, deep learning, and artificial neural networks.

Activity 4: Social or Business Impact.

On a social level, early detection and prediction of CKD can lead to improved patient outcomes and quality of life. By identifying individuals at risk for CKD, healthcare providers can intervene early and slow the progression of the disease through lifestyle changes, medication management, and other treatments. This can help prevent the need for dialysis or kidney transplantation, which can be costly and life-altering for patients. Additionally, early prediction can also help reduce the overall burden of CKD on the healthcare system by reducing the number of hospitalizations and emergency room visits.

Purpose:

There are limited data to describe academic achievement outcomes for children with mild to moderate pediatric chronic kidney disease (CKD). The objective of this study was to describe the prevalence of low academic achievement in patients with mild to moderate CKD.

Design, Setting, Participants, and Measurements:

Wechsler Individual Achievement Test, Second Edition, Abbreviated (WIAT-II-A) data were collected at entry into the Chronic Kidney Disease in Children (CKD) study. Achievement in basic reading, spelling, mathematics, and total achievement was evaluated with a focus on the effects of CKD-related variables and school-based characteristics on academic achievement.

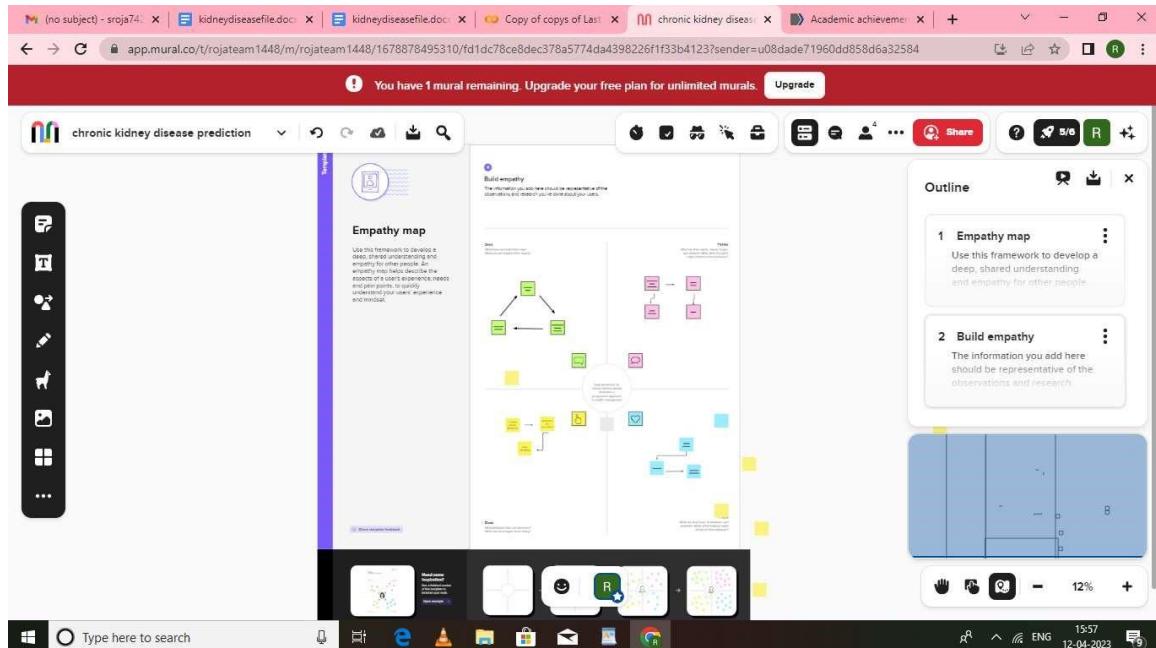

The physical sequence of pediatric chronic kidney disease (CKD) is well characterized. Data support the parallel presence of subtle deficits in even mild to moderate pediatric CKD.

Specifically, cognitive executive function, the ability to plan and make complex decisions, may be impaired in CKD. As with executive function, behavioral concerns are reported by parents of children with CKD. Although the specific mechanisms and behavioral dysfunction associated with CKD are not fully understood, there is evidence to suggest that decline in renal function, early age of onset, and increase the risk for and behavioral shortfalls even before the disease advances to the need for dialysis or transplantation.

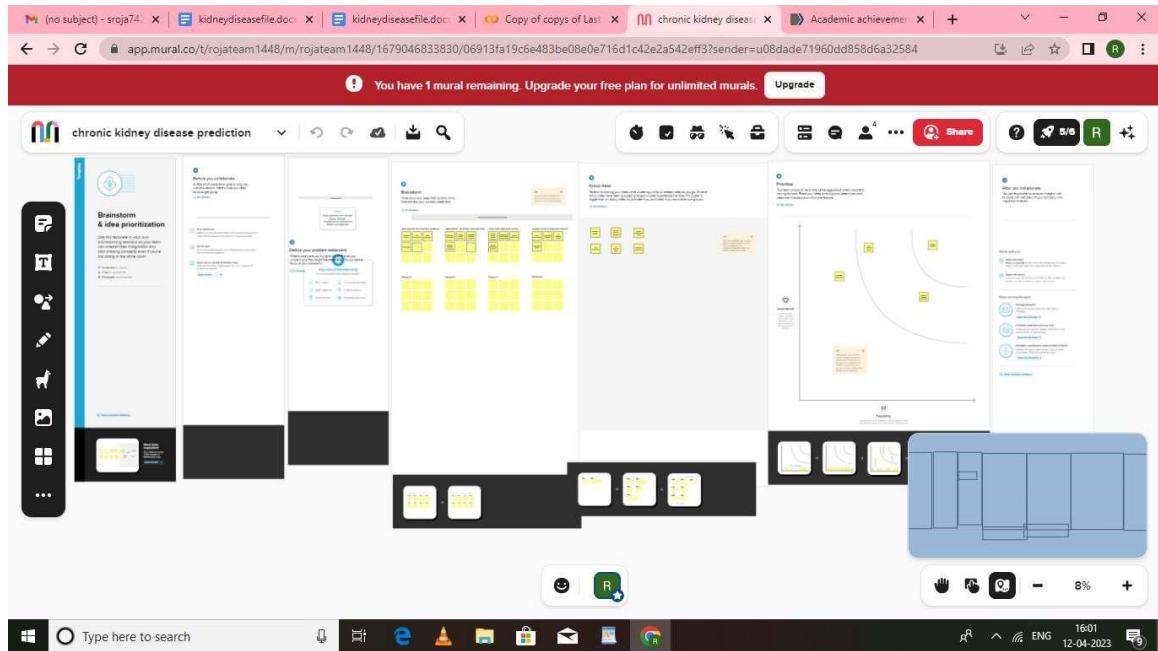

PROBLEM DEFINITION AND DESIGN THINKING

Machine learning has become an increasingly popular tool in recent years, given its ability to automatically detect patterns in data and make predictions about future events. This can be extremely useful for making decisions in a wide range of domain from financial trading to medical diagnoses

ADVANTAGES AND DISADVANTAGES:

Advantages

- The number of patients on renal replacement therapy has doubled every decade since 1980, and prevalence of chronic kidney disease (CKD) in the early stages is also markedly increased.
- In addition, CKD is a significant risk factor for cardiovascular morbidity and mortality. The only effective approach to this problem is prevention and early detection of CKD. In recent years, screening studies have been carried out in several countries
- The findings have defined the scope of the problem and indicated which population groups are at risk of developing CKD. The most numerous are patients with hypertension and diabetes. Also, these studies have indicated that screening should include measurement of serum as well as urine albumin.
- Early detection of CKD allows proper management that could slow down CKD progression, prevent cardiovascular and enable timely initiation of dialysis. Screening for CKD could be best managed by partnership between primary care physicians and nephrologists. It is necessary to educate primary care physicians about CKD, its risk factors and associated co-morbidities.
- Although multiple benefits of screening for CKD are doubtless, the results obtained by screening should be interpreted with caution, bearing in mind that screening detects only markers of kidney disease but not the disease itself.

Disadvantages

- Having CKD increases the chances of having heart disease and stroke. Managing high blood pressure, blood sugar, and cholesterol levels—all factors that increase the risk for heart disease and stroke—is very important for people with CKD.

- This happens when your kidneys don't make enough erythropoietin (EPO), which affects their ability to make red blood cells.
- Bone weakness
- Fluid retention
- Gout.
- Heart disease.
- High blood pressure (hypertension).
- Metabolic acidosis.

Applications:

- The main treatments are: lifestyle changes – to help you stay as healthy as possible. Medicine – to control associated problems, such as high blood pressure and high cholesterol. Dialysis – treatment to replicate some of the kidney's functions, which may be necessary in advanced (stage 5) CKD.
- Lifestyle changes
- The following lifestyle measures are usually recommended for people with kidney disease:
- Stop smoking if you

smoke eat a healthy,

balanced diet

- Medicine
- There's no medicine specifically for CKD, but medicine can help control many of the problems that cause the condition and the complications that can happen as a result of it.
- You may need to take medicine to treat or prevent the different problems caused by CKD.
- High blood pressure
- Good control of blood pressure is vital to protect the kidneys.
- People with kidney disease should usually aim to get their blood pressure down to below 140/90mmHg, but you should aim to get it down to below 130/80mmHg if you also have diabetes

CONCLUSION :

Chronic renal failure represents a critical period in the evolution of chronic renal disease and is associated with complications and co morbidities that begin early in the course of the disease. These conditions are initially subclinical but progress relentlessly and may eventually become symptomatic and irreversible. Early in the course of chronic renal failure, these conditions are amenable to interventions with relatively simple treatments that have the potential to prevent adverse outcomes. Strategies for effective management of chronic renal disease. By acknowledging these facts, we have an excellent opportunity to change the paradigm of management of chronic renal failure and improve patient outcomes.

Additional educational resources

Integrated care by the primary care physician, renal team from an early stage is vital to reduce the overall morbidity and mortality associated with chronic renal disease. Practical points helpful at this stage of renal disease include

Patients receiving comprehensive care by the renal team have shown slower rates of decline in renal function, greater probability of starting dialysis with higher calcium control, a permanent access, and a greater likelihood of choosing peritoneal dialysis¹²

Patients with progressive renal failure should be educated to save vessels of the non-dominant arm for future access; they should have a permanent vascular access (preferably fistula) created when the filtration rate falls below 25 ml/min or renal replacement treatment is anticipated within a year

FUTURE SCOPE :

Imaging: assessing number as a determinant of kidney disease and kidney fibrosis

Imaging techniques have the advantage of being non-invasive and, thus, may be safely repeated to evaluate changes, providing information for both kidneys and potentially combining functional with morphological information. The most interesting advances relate to estimation of number, overall kidney functions, fibrosis and new functional magnetic resonance imaging (MRI), as well as ultrasound techniques such as diffusion-weighted MRI (DWI or DW-MRI), blood oxygenation level-dependent MRI (BOLD-MRI), perfusion MRI, hyperpolarized (HP) carbon 13 MRI (13C MRI) and contrast-enhanced ultrasound (CEUS).

CFE-MRI uses filled with iron oxide future treatments for kidney disease

Novel therapeutic alternatives for ESRD include wearable artificial kidneys, stem cell-based therapy, and bioengineered and bio-artificial kidneys. Of note, one of the main objectives of these novel therapeutic approaches should be to maintain patients at home and to avoid Dialysis APPENDIX import pandas as pd
